

Installation manual of pavement surface boxes.

Surface boxes are placed on the support layer (no support plate required) and aligned.

Extend the inner part of the surface box to the finished height of the pavement.

The gritting material underground is to be deducted to the surface box.

Start laying the paving stones. Now the paving stones are on the same level height as the cap.

Pull the inner part of the surface box off again over the level of the paving stones.

Fill the cap neck with gravel so that the top of the cap is above 1 cm of the level of the paving stones.

This centimeter can vary depending on the gravel size.

Then the entire surface can be compacted with a vibrating plate compactor.

The cap will go along with the environment level. So there is no growing out of the cap.

Installation manual of pavement surface boxes.

If not enough have been stuffed gravel under need the neck of the inner part of the surface box so the cap can be pulled out again at any time and the too low under stuffing has to be repeated.

Finished.
